IRIT-CNRS
Toulouse

Master in Artificial Intelligence

- Formalization of interaction between rational agents
- Belief-Desire-Intention framework
- Action and knowledge
- Temporal logics
- Description logics

Modal Logics for Interaction

- Non-truth functional concepts
 - belief, time, action, obligation,...
- Modal connectives
 - $\text{Bel}_i A$ = “agent i believes that A ”
 - $F A$ = “ A will be true at some future time point”
 - $\text{After}_a A$ = “ A is true after action a ”
 - $\text{Oblg}_i A$ = “ A is obligatory for agent i ”
- Generic form:
 - $\Box A$ = “ A is true in all possible worlds”
 - $\langle \rangle A$ = “ A is true in some possible world”

Logics of action and knowledge

- modal operators

$\text{K}_{\text{nw}_i} A$ “agent i knows that A ”

$[a] A$ “after execution of action a , A holds”

- axiomatically:

$\text{K}_{\text{nw}_i}[a]A \leftrightarrow [a]\text{K}_{\text{nw}_i}A$

$\langle a \rangle \text{K}_{\text{nw}_i}A \rightarrow \text{K}_{\text{nw}_i}\langle a \rangle A$

- relational properties:

$R_{\text{knw}_i} \circ R_a = R_a \circ R_{\text{knw}_i}$ (permutation)

$(R_{\text{knw}_i})^{-1} \circ R_a = R_a \circ (R_{\text{knw}_i})^{-1}$ (confluence)

Belief-Desire-Intention logics

- Modal operators

$Bel_i A$ “agent i believes that A”

$Desire_i A$ “agent i desires that A”

$Intend_i A$ “agent i intends that A”

- Branching temporal logic

Interpreting the language: truth conditions

- Models = Worlds + Relations
- classical connectives

$M, w \Vdash P$ iff $V_w(P) = 1$, for P in Atoms

$M, w \Vdash A \wedge B$ iff $(M, w \Vdash A$ and $M, w \Vdash B)$

- non-classical connectives
 - interpretation via accessibility relation R
- the basic modal operators:

$M, w \Vdash \Box A$ iff for all u : Rwu implies $M, u \Vdash A$

$M, w \Vdash \Diamond A$ iff exists u : Rwu and $M, u \Vdash A$

Models

- model $M = (W, R, V)$
 - W nonempty set (possible worlds)
 - $R: Ops \rightarrow (W \times W)$ (accessibility relation)
 - $V: W \rightarrow (Atoms \rightarrow \{0, 1\})$ (valuation)
- pointed model $((W, R, V), w)$
 - w in W (actual world)

Validity and satisfiability in a class of models C/s

- C/s some subset of \mathbf{K} (one for each logic)
- A is *valid* in C/s iff A is true at any w of any M in C/s ($\models_{C/s} A$)

examples: $\Box P \rightarrow P$ invalid in \mathbf{K}
 $\Box P \rightarrow P$ valid in the class of reflexive models
 $\langle \rangle P \rightarrow \langle \rangle \langle \rangle P$ valid in transitive models

- A is *satisfiable* in C/s iff A is true at some w of some M in C/s

examples: $P \wedge \sim \Box P$ satisfiable in \mathbf{K}
 $P \wedge \sim \Box P$ unsatisfiable in reflexive models

A is valid in C/s iff $\sim A$ is unsatisfiable in C/s

Reasoning problems

- **model checking**

given A , M and w , do we have $M, w \models A$?

- **validity**

given A and Cl_s , is A valid in Cl_s ?

- **satisfiability**

given A and Cl_s , does there exist M in Cl_s and w in M such that $M, w \models A$?

Reasoning problems

- **model checking**

given A , M and w , do we have $M, w \models A$?

- **validity**

given A and CIs , is A valid in CIs ?

- **satisfiability**

given A and CIs , does there exist M in CIs and w in M such that $M, w \models A$?

How can we solve them automatically?

Existing

- Optimized tableaux provers (LWB, FaCT):
 - hacking skills needed (C++,...)
 - do not provide models (yes/no answer)
 - use tricky optimizations (Backjumping)
- no generic natural deduction system
- Hilbert-style proofs are useless
- translation methods difficult to read and need specialized skolemization

Needs

- Build Cls-models (= build graphs)
- Complete premodels to Cls-models
- Evaluate modal formulas on some model
- Look for Cls-models of a formula
- No high programming skills
- Basics on graphs and propositional logic

Overview

- LoTREC: building Kripke models
- tableaux systems: basic ideas
- tableaux systems: basic definitions
- tableaux for simple modal logics
- tableaux for transitive modal logics
- termination, soundness and completeness

LoTREC

- IRIT-CNRS Toulouse
- Downloadable from www.irit.fr
- Explicit accessibility relations
- Easy implementation of complex logics (symmetry, linearity, transitivity, PDL, DL with cardinal restrictions...)
- ... and inefficient

Overview

- LoTREC: building Kripke models
- **tableaux systems: basic ideas**
- tableaux systems: basic definitions
- tableaux for simple modal logics
- tableaux for transitive modal logics
- soundness and completeness

The basic idea for modal logics

- apply truth conditions and guaranty relational properties = build a graph
 - create nodes
 - add links between nodes
 - add formulas to node
- the basic modal cases
 - $M, w \Vdash \Box A \rightarrow$ for all u such that Rwu , add $u \Vdash A$
 - $M, w \Vdash \Diamond A \rightarrow$ add some new u , add Rwu , add $u \Vdash A$

The basic idea: example for modal logic

Find a reflexive model for $A = P \wedge \leftrightarrow (\sim P \wedge \Box P)$

- applying truth conditions:
→ $M, w \Vdash P \wedge \leftrightarrow (\sim P \wedge \Box P)$

The basic idea: example for modal logic

Find a reflexive model for $A = P \wedge \langle \rangle (\sim P \wedge \Box P)$

- applying truth conditions:

→ $M, w \Vdash P \wedge \langle \rangle (\sim P \wedge \Box P)$

→ $M, w \Vdash P$ $M, w \Vdash \langle \rangle (\sim P \wedge \Box P)$

The basic idea: example for modal logic

Find a reflexive model for $A = P \wedge \leftrightarrow(\sim P \wedge \Box P)$

- applying truth conditions:

→ $M, w \Vdash P \wedge \leftrightarrow(\sim P \wedge \Box P)$

→ $M, w \Vdash P$ $M, w \Vdash \leftrightarrow(\sim P \wedge \Box P)$

The basic idea: example for modal logic

Find a reflexive model for $A = P \wedge \leftrightarrow(\sim P \wedge \Box P)$

- applying truth conditions:

→ $M, w \Vdash P \wedge \leftrightarrow(\sim P \wedge \Box P)$

→ $M, w \Vdash P$ $M, w \Vdash \leftrightarrow(\sim P \wedge \Box P)$

→ **New u : $Rwu, M, u \Vdash (\sim P \wedge \Box P)$**

The basic idea: example for modal logic

Find a reflexive model for $A = P \wedge \leftrightarrow(\sim P \wedge \Box P)$

- applying truth conditions:
 - $M, w \Vdash P \wedge \leftrightarrow(\sim P \wedge \Box P)$
 - $M, w \Vdash P$ $M, w \Vdash \leftrightarrow(\sim P \wedge \Box P)$
 - New u : Rwu , $M, u \Vdash (\sim P \wedge \Box P)$
 - $M, u \Vdash \sim P$ and $M, u \Vdash \Box P$

The basic idea: example for modal logic

Find a reflexive model for $A = P \wedge \leftrightarrow(\sim P \wedge \Box P)$

- applying truth conditions:

→ $M, w \Vdash P \wedge \leftrightarrow(\sim P \wedge \Box P)$

→ $M, w \Vdash P$ $M, w \Vdash \leftrightarrow(\sim P \wedge \Box P)$

→ New u : Rwu , $M, u \Vdash (\sim P \wedge \Box P)$

→ $M, u \Vdash \sim P$ and $M, u \Vdash \Box P$

No more truth conditions
But not reflexive model

The basic idea: example for modal logic

Find a reflexive model for $A = P \wedge \leftrightarrow(\sim P \wedge \Box P)$

- applying truth conditions:
 - $M, w \Vdash P \wedge \leftrightarrow(\sim P \wedge \Box P)$
 - $M, w \Vdash P$ $M, w \Vdash \leftrightarrow(\sim P \wedge \Box P)$
 - New u : Rwu , $M, u \Vdash (\sim P \wedge \Box P)$
 - $M, u \Vdash \sim P$ and $M, u \Vdash \Box P$
- applying completion: Rww and Ruu

The basic idea: example for modal logic

Find a reflexive model for $A = P \wedge \leftrightarrow(\sim P \wedge \Box P)$

- applying truth conditions:
 - $M, w \Vdash P \wedge \leftrightarrow(\sim P \wedge \Box P)$
 - $M, w \Vdash P$ $M, w \Vdash \leftrightarrow(\sim P \wedge \Box P)$
 - New u : Rwu , $M, u \Vdash (\sim P \wedge \Box P)$
 - $M, u \Vdash \sim P$ and $M, u \Vdash \Box P$
- applying completion: Rww and Ruu

But then apply \Box truth condition on u

The basic idea: example for modal logic

Find a reflexive model for $A = P \wedge \leftrightarrow (\sim P \wedge \Box P)$

- applying truth conditions:
 - $M, w \Vdash P \wedge \leftrightarrow (\sim P \wedge \Box P)$
 - $M, w \Vdash P$ $M, w \Vdash \leftrightarrow (\sim P \wedge \Box P)$
 - New u : Rwu , $M, u \Vdash (\sim P \wedge \Box P)$
 - $M, u \Vdash \sim P$ and $M, u \Vdash \Box P$
- applying completion: Rww and Ruu
- applying again truth conditions:
 - $M, u \Vdash P$ **Contradiction !**

The basic idea: example for modal logic

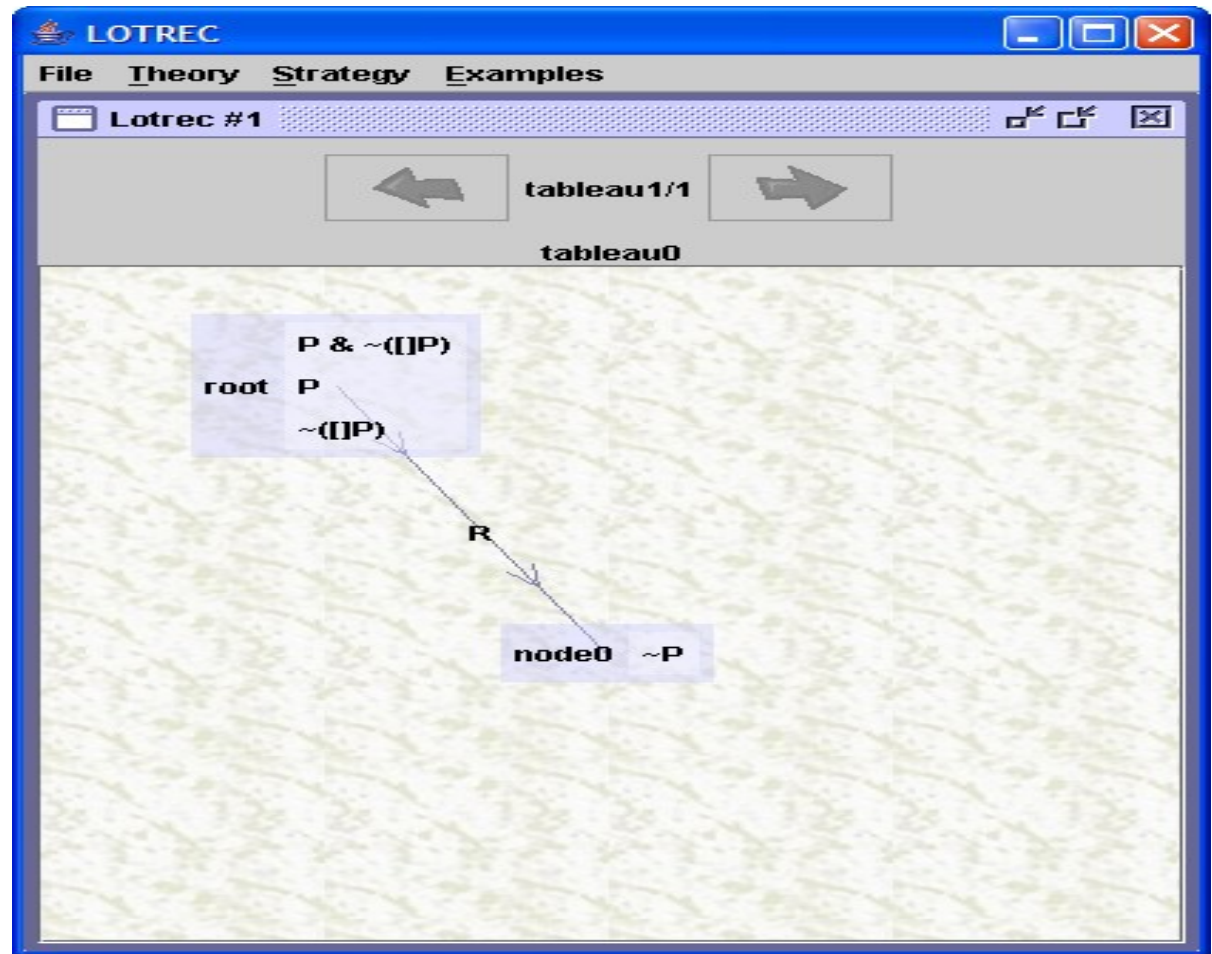

Find a reflexive model for $A = P \wedge \langle \rangle (\sim P \wedge \langle \rangle Q)$

- applying truth conditions:
 - $M, w \Vdash P$ $M, w \Vdash \langle \rangle (\sim P \wedge \langle \rangle Q)$
 - Rwu and $M, u \Vdash \sim P$ and $M, u \Vdash \langle \rangle Q$
- applying completion:
 - Rww and Ruu
- applying again truth conditions:
 - $M, u \Vdash Q$ Reflexive model of A

The basic idea: example for modal logic (ctd.)

- premodel for
 $A = P \wedge \langle \rangle \sim P$

- not closed
- model of A

Overview

- LoTREC: building Kripke models
- tableaux systems: basic ideas
- **tableaux systems: basic definitions**
- tableaux for simple modal logics
- tableaux for transitive modal logics
- soundness and completeness

Informal definition of tableau rules

- Tableau rules: truth conditions and relational properties by expanding graphs.
- The needs are
 - add formulas to nodes
 - add nodes
 - add links
 - duplicate the graph (for disjunctive formulas/properties)
 - define strategies (ordering of rules)

Informal definition of tableau rules

- Tableau rules: truth conditions and relational properties by expanding graphs.

LoTREC: apply rule to *every* pattern of G

- strategies get more declarative
- programming is easy
- proofs get easier

Tableau rules: syntax

- general form:
rule *ruleName*
if *cond*₁
...
if *cond*_{*n*}
do *action*₁
...
do *action*_{*k*}

Tableau rules: syntax

- general form:
rule *ruleName*
if *cond*₁
...
if *cond*_{*n*}
do *action*₁
...
do *action*_{*k*}
- example conditions:
if hasElement node formula
if isLinked node₁ node₂ R
... (*more to come*)
- example actions:
do stop
do add node formula
do newNode node
do link node₁ node₂ R
do duplicate node₁ [...]
... (*more to come*)

Building model is easy

```
rule model1
  if isNewNode w
  do newNode x
  do newNode y
  do link w x R
  do link x w R
  do link w y R
  do add x constant p
  do add x constant q
  do add y constant p
  do add y (not constant q)
end
```

Definition of strategies

- A *strategy* defines some order of application of the tableau rules:

firstrule *rule*₁ ... *rule*_{*n*} **end**

“apply first applicable rule (and stop)”

allrules *rule*₁ ... *rule*_{*n*} **end**

“apply all applicable rules in order”

repeat *strategy* **end**

“repeat until no rule applicable”

- Strategy stops if no rule is applicable.

Strategy for classical logic

strategy CPLStrategy

repeat allRules

Stop

NotNot

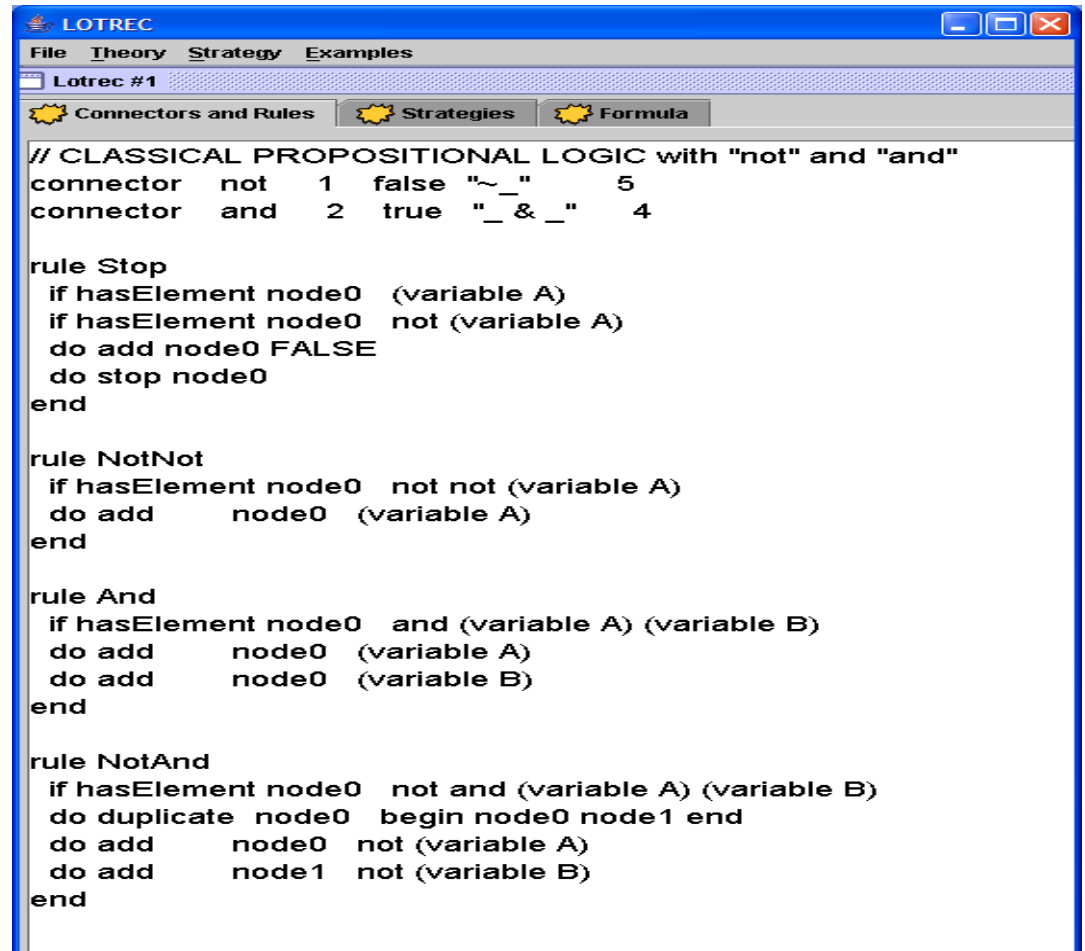

And

NotAnd

end end

end

→ “fair strategy”

```
LOTREC
File Theory Strategy Examples
Lotrec #1
Connectors and Rules Strategies Formula
// CLASSICAL PROPOSITIONAL LOGIC with "not" and "and"
connector not 1 false "~_" 5
connector and 2 true "_&_" 4

rule Stop
  if hasElement node0 (variable A)
  if hasElement node0 not (variable A)
  do add node0 FALSE
  do stop node0
end

rule NotNot
  if hasElement node0 not not (variable A)
  do add node0 (variable A)
end

rule And
  if hasElement node0 and (variable A) (variable B)
  do add node0 (variable A)
  do add node0 (variable B)
end

rule NotAnd
  if hasElement node0 not and (variable A) (variable B)
  do duplicate node0 begin node0 node1 end
  do add node0 not (variable A)
  do add node1 not (variable B)
end
```

Definition of tableaux

The *set of tableaux for A with strategy S* is
the set of graphs
obtained by applying the strategy S
to an initial single-node graph
whose root contains only A.

- notation: $S(A)$

Tableaux: open or closed?

- *A node is closed* iff it contains FALSE.
- *A tableau is closed* iff it has a closed node.
- *A set of tableaux is closed*
iff all its elements are.

Formal properties

To be proved for each strategy:

- Termination

For every A , $S(A)$ terminates.

- Soundness

If $S(A)$ is *closed* then A is *unsatisfiable*.

- Completeness

If $S(A)$ is *open* then A is *satisfiable*.

In general ...

- soundness proofs: easy (we apply truth conditions)
- termination proofs: not so easy (case-by-case)
- completeness proofs...
 - ... for fair strategies:
standard techniques, work “in most cases”
but fair strategies do not terminate in general
 - ... for terminating strategies:
difficult (rigorous proofs rare even for the
basic modal logics!)
reason: strategy = imperative programming

Tableau rules for K

not, and, nec

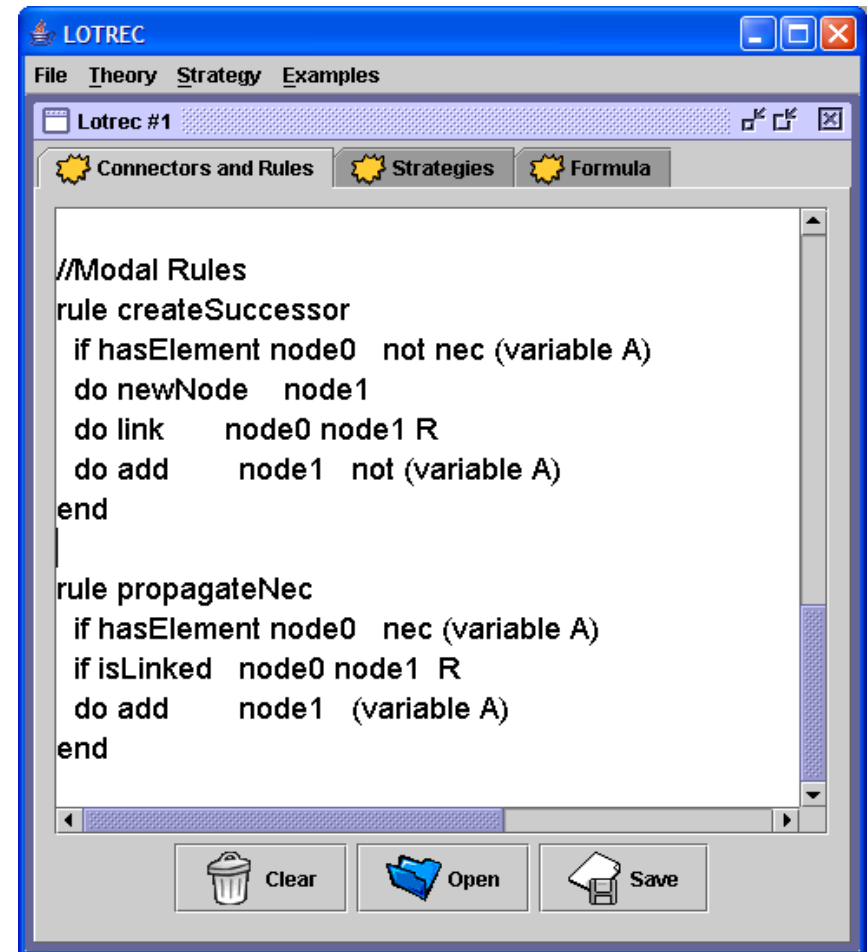

[rules for classical logic]

Tableau rules for K

not, and, nec

[rules for classical logic]

createSuccessor: \longrightarrow
if $\sim[\Box]A$ is in node0
then
 create a new node1
 link it to node0
 add A to node1
end

The screenshot shows the LOTREC application window. The title bar reads 'LOTREC'. The menu bar includes 'File', 'Theory', 'Strategy', and 'Examples'. The main window has three tabs: 'Connectors and Rules', 'Strategies', and 'Formula'. The 'Connectors and Rules' tab is active, displaying a text editor with the following code:

```
//Modal Rules
rule createSuccessor
  if hasElement node0  not nec (variable A)
  do newNode  node1
  do link      node0 node1 R
  do add      node1  not (variable A)
end

rule propagateNec
  if hasElement node0  nec (variable A)
  if isLinked  node0 node1 R
  do add      node1  (variable A)
end
```

At the bottom of the window, there are three buttons: 'Clear' (with a trash can icon), 'Open' (with a folder icon), and 'Save' (with a floppy disk icon).

Tableau rules for K

not, and, nec

[rules for classical logic]

propagateNec:
if $\Box A$ is in node0
node0 is linked to node1
then add A to node1
end

Modal logic KT

- accessibility relation is *reflexive*
- alternative way: integrate this into truth condition
 - $M, w \Vdash \Box A$ iff for all u : Rwu implies $M, u \Vdash A$

Modal logic KT

- accessibility relation is *reflexive*
- alternative way: integrate this into truth condition
 - $M, w \Vdash \Box A$ iff for all u : Rwu implies $M, u \Vdash A$
and $M, w \Vdash A$

  if contains node0 node1
  do mark node1 CONTAINED
end
```

S4Strategy

$(\Box \leftrightarrow \Box (P \vee Q)) \ \& \ \Box \leftrightarrow \sim P \ \& \ \leftrightarrow \Box \sim Q$

Overview

- LoTREC: building Kripke models
- tableaux systems: basic ideas
- tableaux systems: basic definitions
- tableaux for simple modal logics
- tableaux for transitive modal logics
- **termination, soundness and completeness**

A general termination theorem

- **IF** for every rule r :
(the do-part of r only contains **strict** subformulas of the if-part of r
AND
[some restriction on node creation])
- **THEN**
for every formula A :
the tableaux construction terminates

Another general termination theorem

- **IF** for every rule r :
 - the do-part of r only contains subformulas of the if-part of r
 - AND**
[some restriction on node creation]
 - AND**
[some *looptesting* in the strategy]
- **THEN**
 - for every formula A :
 - the tableaux construction terminates

Soundness

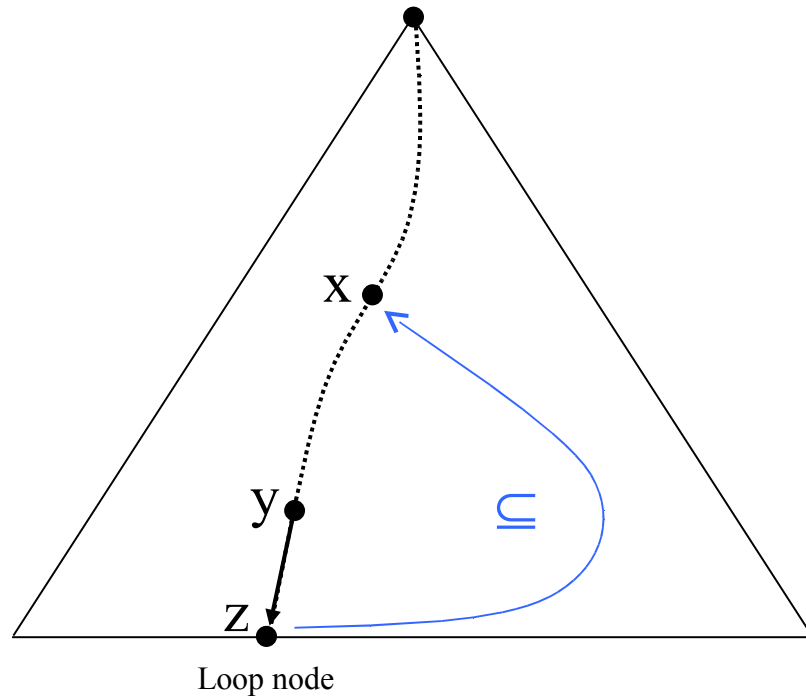

- Let L be any logic in $\{\dots\}$. If L -Strategy(A) is closed then A is L -unsatisfiable.
- Proof:
 - Every tableau rule is “guaranteed” by the truth conditions:
 - If G is L -satisfiable
 - then there is G_i in $\text{rule}(G)$ that is L -satisfiable
 - Hence if *every* tableau is closed then the original A cannot be L -satisfiable.

Completeness

- Let L be any logic in $\{\dots\}$. If $L\text{-Strategy}(A)$ is open then A is L -satisfiable.
- Proof:
 - Take some open tableau G in $L\text{Strategy}(A)$.
 - Build a L -model from G :
 - $V_{\text{node}}(P) = 1$ iff P appears in node and P atomic
 - Prove by induction on the form of A :
 - for every A in node, $M, \text{node} \Vdash A$
 - (“fundamental lemma”)
 - Folding...

Folding

1. Loop detection

Folding

2. Node and edge deletion

Folding

3. Folding itself

Completeness

Theorem :

ANY FAIR STRATEGY for a logic $K+[D, T, 4, 5, B]$ using the adequate rules is terminating and complete.

Future improvements

- Non polish notation for input formulas
- Drag-and-drop model building
- Drag-and-drop model modification
- Graphical design of rules
- Reuse of models
- First-order logic
- Interface with efficient SAT solvers
- Nodes collapsing, ...

LoTREC on LILaC homepage at www.irit.fr (~ 6.5 Mo)

- model construction
= model description
- formula evaluation and model search
= description of truth conditions
and relational properties
- wide range of logics:
multiK +/- {F,D,T,B,4,5,Lin,Cf,...}
LTL, PDL, DL's, some non-normal ML's
- correctness and termination results
